Emergent procedures for patients with known or suspected COVID-19 will undergo a risk/benefit assessment prior to proceeding with the case. The review will be conducted with the care team, medical director (or designee), and infection prevention team at a minimum.

If a decision to proceed is made, then the procedure must be done using all of the following: Airborne/Respirator, Contact, and Eye Shield. If the procedure requires intubation, the procedural team will follow current PPE guidance for performing an aerosolizing procedure.
