
Current testing capacity across UW Medicine is adequate, therefore outpatient testing is left up to provider discretion. We continue to prioritize COVID-19 testing for symptomatic people with risk factors listed in the table below.

Those who do not meet criteria for testing but are symptomatic should stay home for 7 days or 72 hours after symptom resolution, whichever is longer. If a person is doing well at home and testing is unlikely to change management, please consider the utility of bringing someone in for testing alone. A negative test result does not definitively rule out an infection.

</table>
| New symptoms of acute respiratory infection (such as fever, cough, shortness of breath, myalgias, rhinorrhea, sore throat, anosmia, ageusia) And does NOT require hospitalization | • Healthcare workers and first responders  
• Person working in a critical infrastructure occupation¹  
• Pregnant persons  
• Adults older than 60 years  
• Persons living homeless/unstably housed  
• Persons living in a congregate setting²  
• Persons with chronic lung disease (eg. COPD, asthma)  
• Use of an immunosuppressive medication (eg. Prednisone, rituximab, chemotherapy)  
• Persons with an immunocompromising condition (eg. Current cancer, history of transplantation (solid organ or bone marrow), diabetes, dialysis, HIV, cirrhosis, rheumatoid arthritis, lupus)  
• Close contact with a confirmed case³  
• Spent time at any skilled nursing facility | Yes⁴ |
| New symptoms of acute respiratory infection (such as fever, cough, shortness of breath, myalgias, rhinorrhea, sore throat, anosmia, ageusia) requiring hospitalization |                | Yes⁴ |
1 **Critical infrastructure occupation**: E.g., grocery store, restaurant, gas station, public utilities or transportation occupations

2 **Congregate settings**: e.g. skilled nursing facilities/adult family homes, correctional facilities, homeless/shelters, other institution/congregate setting, dorms, fraternities/sororities

3 **Close contact**: Approximately 6 feet of a COVID-19 case for a prolonged period of time; close contact can occur while caring for, living with, visiting, or sharing a healthcare waiting area or room with a COVID-19 case or having direct contact with infectious secretions of a COVID-19 case (e.g., being coughed on)

4 **SARS-CoV-2 sample collection**: Nasopharyngeal swabs often generate a strong cough reflex. Standard/Contact/Droplet precautions are recommended. Please remember to collect samples from both nostrils, using the same swab. If your patient is intubated, please obtain endotracheal tube (ETT) aspirate as well. For additional instructions, please refer to Sample Collection for COVID19 Testing on our [UW Medicine COVID-19 Website](https://www.uwmedicine.org/covid-19). For ordering information, please review [UW Laboratory Test Guide](https://www.uwmedicine.org/covid-19).

If COVID-19 is being considered, whether testing is performed or not, please provide patients with the following guidance documents so that they know how to best prevent the spread of infection to other people.

- Patients with confirmed or suspected COVID-19
- Patients who were exposed to a confirmed COVID-19 case
- Unexposed patients with COVID-19 symptoms
